IQS318 DATASHEET

Single channel standalone and I²C proximity or touch sensing controller. It features low power consumption and different adjustable settings such as sensitivity, sampling period, and sensing threshold.

1 Device Overview

The IQS318 ProxFusion® IC is both a standalone and I²C sensing device for single channel proximity or touch sensing requirements. The sensor is configurable via external input pins and on-chip calculations enable the IC to respond effectively in various use cases.

1.1 Main Features

- Multiple user interface options:
  - Single channel I²C / standalone inductive switch (with long term activation: IQS318-0xx)
  - Single channel I²C / standalone inductive button / single level trigger (IQS318-1xx)
  - Single channel I²C / standalone inductive snap button (IQS318-2xx)
  - Single channel I²C / standalone self-capacitive switch (with long term activation: IQS318-5xx)
- 1 (self) / 2 (inductive) external sensor pad connection
- Built-in basic functions:
  - Automatic tuning
  - Noise filtering
  - Debounce & hysteresis
- Built-in signal processing options:
  - Single I²C touch/proximity output
  - Single standalone touch output
- Design simplicity
  - Configurable channel sensitivity, sample period, threshold, and charge transfer frequency using external input pins
  - One-time programmable settings for custom IC configuration (MOQs apply)
- I²C debugging interface with IRQ/RDY(up to fast plus -1MHz)
- Supply voltage 1.71V to 3.5V
- Package options
  - WLCSP11 (1.48 x 1.08 x 0.345 mm) - interleaved 0.35mm x 0.35mm ball pitch
  - DFN12 (3 x 3 x 0.75 mm) - 0.5mm pitch
  - QFN20 (3 x 3 x 0.55 mm) - 0.4mm pitch

1.2 Applications

- General-use button/switch
- Wear detection
- Backlight activation
- Tamper switch (release detection)
- Snap button

1.3 Block Diagram

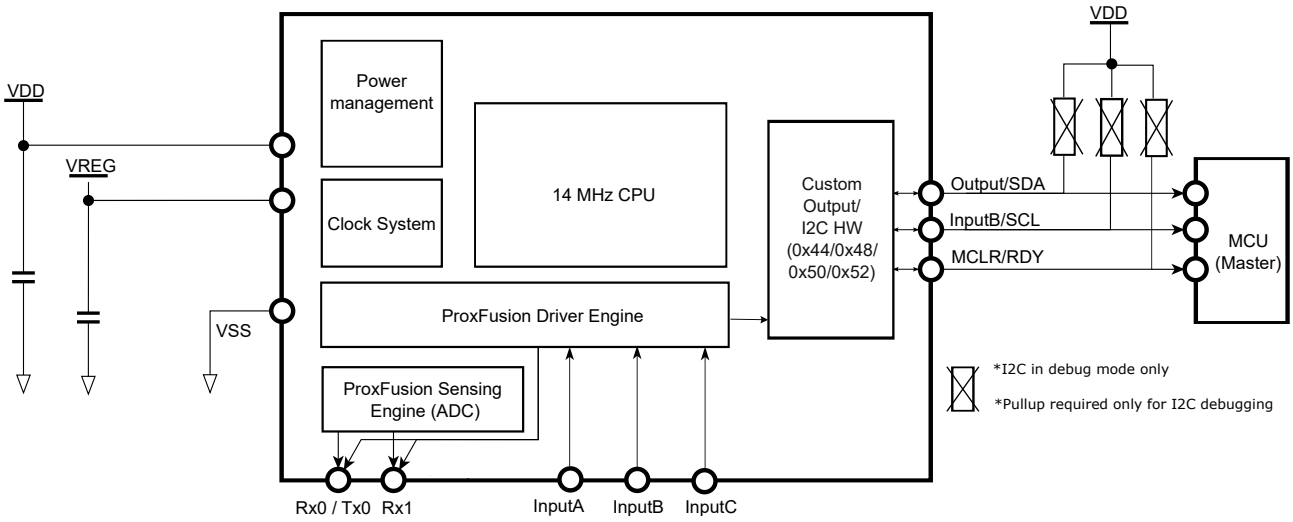

Figure 1.1: Functional Block Diagram

1.4 Order Code Description

1.4.1 IQS318-0xx

The IQS318-0xx is a single channel I²C (IQS318-000) / standalone (IQS318-001) inductive switch application that make use of the long term activation UI.

Applications of the IQS318-0xx order codes include general-use inductive switches and tamper switches (release detection).

1.4.2 IQS318-1xx

The IQS318-1xx is a single channel I²C (IQS318-100) / standalone (IQS318-101) inductive button application without the long term activation UI.

Applications of the IQS318-1xx order codes include general-use inductive buttons that will recover automatically even if a harsh environment causes them to become latched accidentally.

1.4.3 IQS318-2xx

The IQS318-2xx is a single channel I²C (IQS318-200) / standalone (IQS318-201) inductive button application without the long term activation UI.

Applications of the IQS318-2xx order codes include inductive snap buttons. The IQS318-2xx also covers a wide range of snap domes and PCB overlays. The algorithm of this solution is tuned for the snap button profile rather than just a threshold crossing. A single sensitivity setting applies to various different snap-dome and overlay combinations. An alternate excitation frequency option exists for applications where multiple inductive coils are placed next to each other. This prevents interference between coils. Alternating coil frequencies are recommended when placing multiple coils next to each other.

1.4.4 IQS318-5xx

The IQS318-5xx is a single channel I^2C (IQS318-510) / standalone (IQS318-511) capacitive switch application that make use of the long term activation UI.

Applications of the IQS318-5xx order codes include capacitive wear detection, lid open-close switches, and backlight activation.

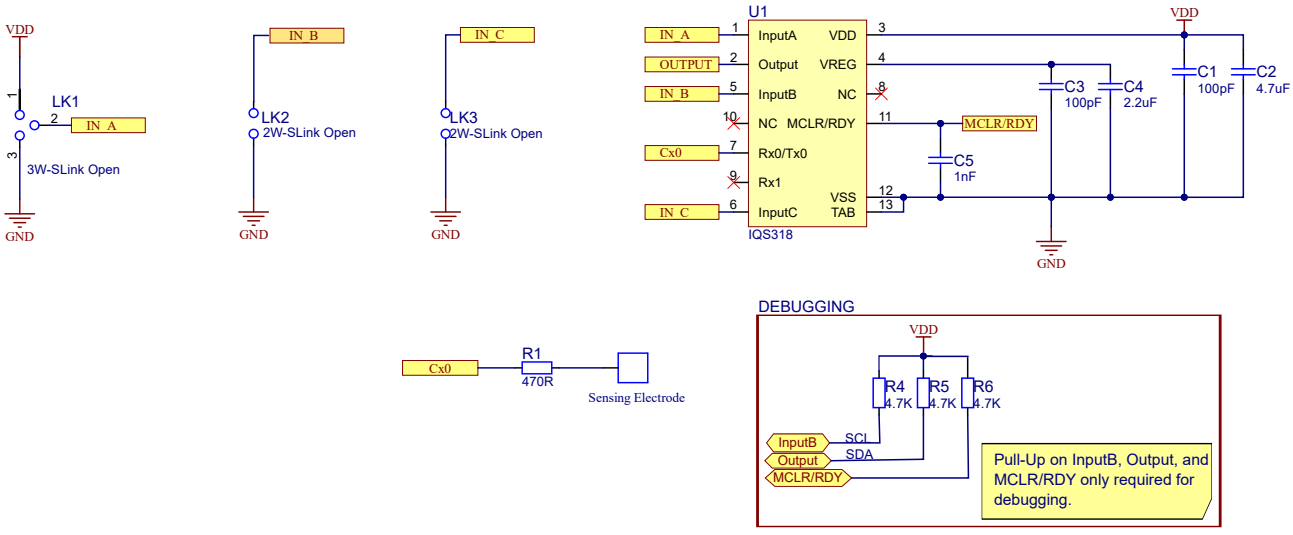

Figure 2.2: DFN12 Self-Capacitive Reference Schematic (IQS318-5xx) [i]

[i] For I²C debugging, $4.7k\Omega$ pull-ups are required on Output, InputB and MCLR/RDY

3 Electrical Characteristics

3.1 Absolute Maximum Ratings

	Min	Max	Unit
Voltage applied at VDD pin to VSS	1.71	3.5	V
Voltage applied to any ProxFusion® pin	-0.3	VREG	V
Voltage applied to any other pin (referenced to VSS)	-0.3	VDD + 0.3 (3.5V max)	V
Storage temperature, T_{stg}	-40	85	°C

3.2 Recommended Operating Conditions

Recommended operating conditions		Min	Nom	Max	Unit
VDD	Supply voltage applied at VDD pin	1.71		3.5	V
VREG	Internal regulated supply output for analog domain		1.53		V
VSS	Supply voltage applied at VSS pin	0	0	0	V
T_A	Operating free-air temperature	-40	25	85	°C
C_{VDD}	Recommended capacitor at VDD	$2*C_{VREG}$	$3*C_{VREG}$		µF
C_{VREG}	Recommended external buffer capacitor at VREG, ESR≤ 200mΩ	2	5	13	µF
$Cx_{\_SELF-VSS}$	Maximum capacitance of all external electrodes on all ProxFusion® blocks (self-capacitance mode)	-	-	400	pF
$RCx_{\_SELF}$	Series (in-line) resistance of all self capacitance pins in self capacitance mode	0[i]	0.47	10[ii]	kΩ

3.3 ESD Rating

		Value	Unit
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[iii]	± 2000	V

[i] Nominal series resistance of 470Ω is recommended to prevent received and emitted EMI effects. Typical resistance also adds additional ESD protection

[ii] Series resistance limit is a function of f_{xfer} and the circuit time constant, RC. R_{max} x C_{max} = $\frac{1}{(6xf_{xfer})}$ where "C" is the pin capacitance to Vss.

[iii] JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±2000 V may actually have higher performance.

3.4 Current Consumption

3.4.1 IQS318-000: I²C Inductive Switch (Long Term Activation)

Configuration	Sampling period [ms]	Active channels	Typical Power Consumption [µA] 3.3V[i]
InputC floating	200	Inductive (1 channel)	4.5
InputC to VSS	43	Inductive (1 channel)	25.6

3.4.2 IQS318-001: Standalone Inductive Switch (Long Term Activation)

Configuration	Sampling period [ms]	Active channels	Typical Power Consumption [µA] 3.3V[i]
InputC floating	200	Inductive (1 channel)	4.3
InputC to VSS	43	Inductive (1 channel)	24.4

3.4.3 IQS318-100: I²C Inductive Button

Configuration	Sampling period [ms]	Active channels	Typical Power Consumption [µA] 3.3V[i]
InputC floating	200	Inductive (1 channel)	4.6
InputC to VSS	43	Inductive (1 channel)	15.2

3.4.4 IQS318-101: Standalone Inductive Button

Configuration	Sampling period [ms]	Active channels	Typical Power Consumption [µA] 3.3V[i]
InputC floating	200	Inductive (1 channel)	4.3
InputC to VSS	43	Inductive (1 channel)	17.3

3.4.5 IQS318-200: I²C Inductive Snap Button

Configuration	Sampling period [ms]	Active channels	Typical Power Consumption [µA] 3.3V[i]
InputC floating	200	Inductive (1 channel)	4.7
InputC to VSS	43	Inductive (1 channel)	24.8

3.4.6 IQS318-201: Standalone Inductive Snap Button

Configuration	Sampling period [ms]	Active channels	Typical Power Consumption [µA] 3.3V[i]
InputC floating	200	Inductive (1 channel)	4.3
InputC to VSS	43	Inductive (1 channel)	14.6

3.4.7 IQS318-510: I²C Self-Capacitive Switch (Long Term Activation)

Configuration	Sampling period [ms]	Active channels	Typical Power Consumption [µA] 3.3V[i]
InputC floating	200	Self-capacitance (1 channel)	3.6
InputC to VSS	43	Self-capacitance (1 channel)	9.6

3.4.8 IQS318-511: Standalone Self-Capacitive Switch (Long Term Activation)

Configuration	Sampling period [ms]	Active channels	Typical Power Consumption [µA] 3.3V[i]
InputC floating	200	Self-capacitance (1 channel)	3.1
InputC to VSS	43	Self-capacitance (1 channel)	8.3

[i] Long term averages - higher power consumption expected momentarily during activated states.

4 Timing and Switching Characteristics

4.1 Reset Levels

Table 4.1: Reset Levels

Parameter		Min	Max	Unit
V_{VDD}	Rising edge (Reset release) - slope >100V/s	-	1.65	V
	Falling edge (Reset trigger) - slope >100V/s	0.90	-	V

4.2 MCLR Pin Levels and Characteristics

Table 4.2: MCLR Pin Characteristics

Parameter		Conditions	Min	Typ	Max	Unit
$V_{IL(MCLR)}$	MCLR Input low level voltage	VDD = 3.3V	VSS – 0.3	-	1.05	V
		VDD = 1.7V			0.75	
$V_{IH(MCLR)}$	MCLR Input high level voltage	VDD = 3.3V	2.25	-	VDD + 0.3	V
		VDD = 1.7V	1.05			
$R_{PU(MCLR)}$	MCLR pull-up equivalent resistor		180	210	240	kΩ
$t_{PULSE(MCLR)}$	MCLR input pulse width – no trigger	VDD = 3.3V	-	-	15	ns
		VDD = 1.7V			10	
$t_{TRIG(MCLR)}$	MCLR input pulse width – ensure trigger		250	-	-	ns

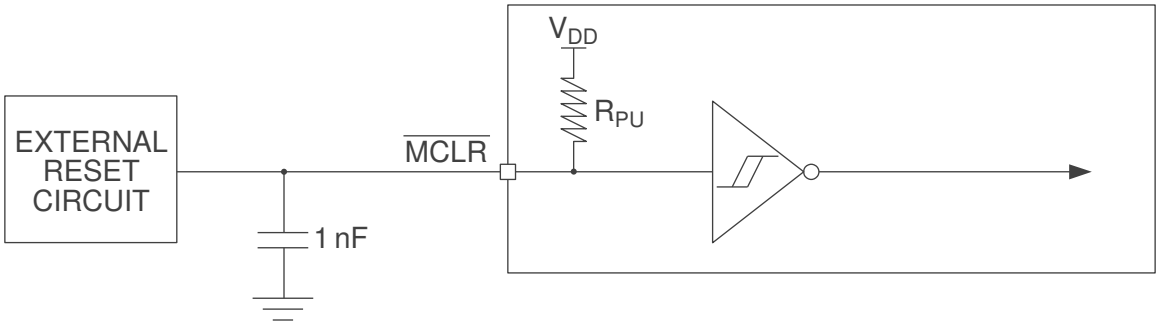

Figure 4.1: MCLR Pin Diagram

4.3 Digital I/O Characteristics

Table 4.3: Digital I/O Characteristics

Parameter		Test Conditions	Min	Typ	Max	Unit
V_{OL}	Output & InputB Output low voltage	I_{sink} = 20mA			0.3	V
V_{OH}	Output high voltage	I_{source} = 20mA	VDD - 0.2			V
V_{IL}	Input low voltage		VDD * 0.3			V
V_{IH}	Input high voltage				VDD * 0.7	V
C_{b_max}	Output & InputB maximum bus capacitance				550	pF

4.4 I²C Characteristics

Table 4.4: I²C Characteristics

Parameter		Test Conditions	VDD	Min	Typ	Max	Unit
f_{SCL}	SCL clock frequency		1.8V, 3.3V			1000	kHz
$t_{HD,STA}$	Hold time (repeated) START		1.8V, 3.3V	0.26			µs
$t_{SU,STA}$	Setup time for a repeated START		1.8V, 3.3V	0.26			µs
$t_{HD,DAT}$	Data hold time		1.8V, 3.3V	0			ns
$t_{SU,DAT}$	Data setup time		1.8V, 3.3V	50			ns
$t_{SU,STO}$	Setup time for STOP		1.8V, 3.3V	0.26			µs
t_{SP}	Pulse duration of spikes suppressed by input filter		1.8V, 3.3V	0		50	ns

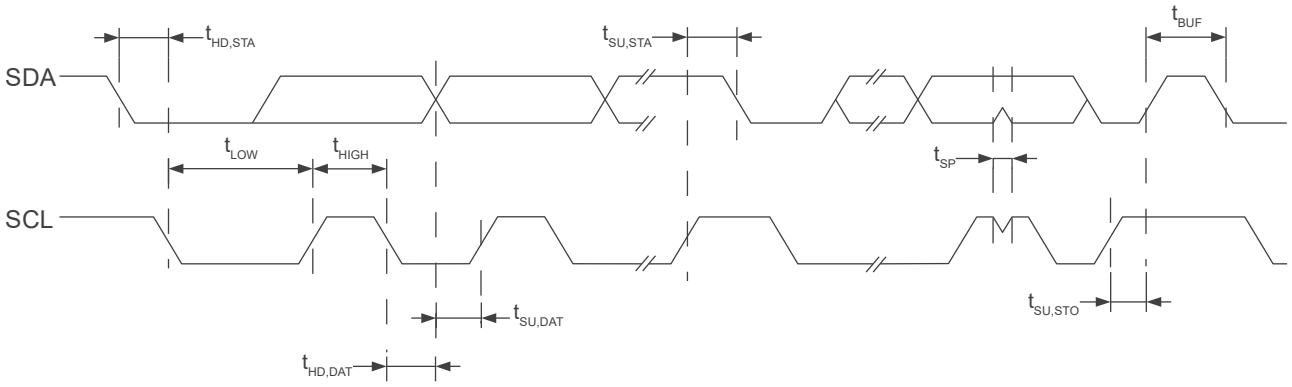

Figure 4.2: I²C Mode Timing Diagram

5 Basic Standalone Functionality

5.1 Input Pin Functionality

The IQS318 offers three input pins that can be used to adjust the threshold, sensitivity, sampling period, and charge transfer frequency. Table 5.1 shows the different input pin configurations.

Table 5.1: IQS318 input pin description

Input pin	Floating	VDD[iv]	VSS[v]
InputA[i]	N/A	**InputA IQS318-2xx order code:** 14MHz charge transfer frequency	**InputA IQS318-2xx order code:** 7MHz charge transfer frequency
		InputA other order codes: High threshold (less sensitive)	**InputA other order codes:** Low threshold (more sensitive)
InputB[ii]	High sensitivity	N/A	Low sensitivity
InputC[iii]	Low sampling period	N/A	High sampling period

Take note that debugging is not possible when InputB is shorted to VSS. Both InputB and Output must have pull-up resistors connected.

5.2 Output Pin Functionality

Output is used to indicate when a touch event has occurred. The Output of the IQS318 order codes are configured as a push-pull active low pin and is set to VSS when a touch is detected and to VDD when a release event is detected. The IQS318 power-on state description is shown in Table 5.2.

Table 5.2: IQS318 power-on state description

IC order option (all output active low)	POR state of the output pin	Output pin state description
IQS318-000	High	Not in touch
IQS318-001	High	Not in touch
IQS318-100	High	Not in touch
IQS318-101	High	Not in touch
IQS318-200	High	Not in touch
IQS318-201	High	Not in touch
IQS318-510	Low	In touch / In wear / Lid closed
IQS318-511	Low	In touch / In wear / Lid closed

[i] InputA should never be left floating. The IQS318-2xx use InputA to set the charge transfer frequency (f_{xfer}) while all the remaining order codes use InputA to set the threshold.

[ii] When InputB is left floating, the internal pull-up is enabled and InputB is pulled high. InputB must not be pulled high externally to VDD.

[iii] InputC must not be pulled high to VDD.

[iv] Pins are shorted to VDD.

[v] Pins are shorted to VSS.

5.3 Standalone Power On Sequence of the IQS318-511

On startup, the output of the IQS318-511 will follow the sequence shown in Figures 5.1 and 5.2. The time interval, t_{init}, is typically less than 12ms and t_{start_up}, is typically less than 250ms.

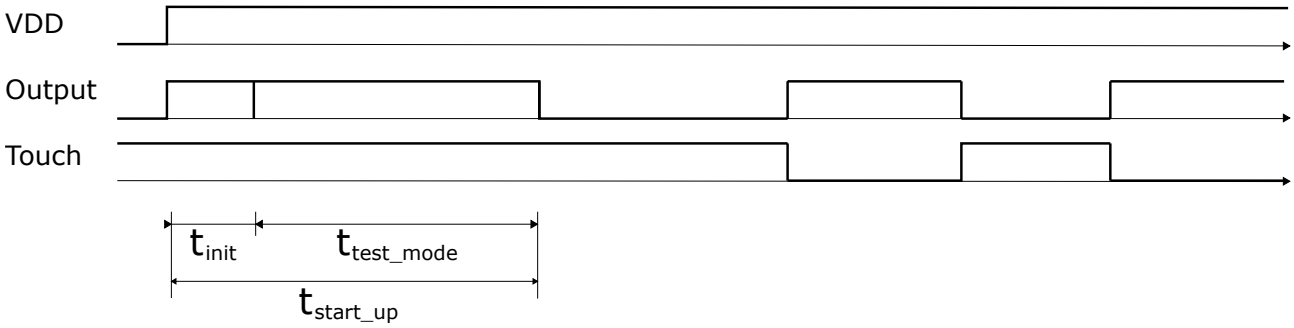

Figure 5.1: IQS318-511 output timing diagram (touch at POR)

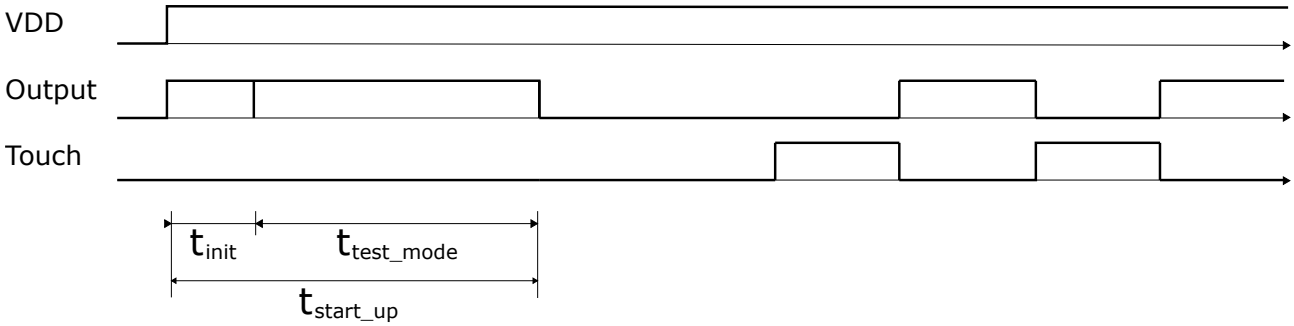

Figure 5.2: IQS318-511 output timing diagram (no touch at POR)

5.4 Standalone Power On Sequence of the IQS318-001, IQS318-101, and IQS318-201

For the IQS318-001, IQS318-101, and IQS318-201 order codes, the output on startup will follow the sequence shown in Figures 5.3 and 5.4. The time interval, t_{init}, is typically less than 12ms and t_{start_up}, is typically less than 250ms.

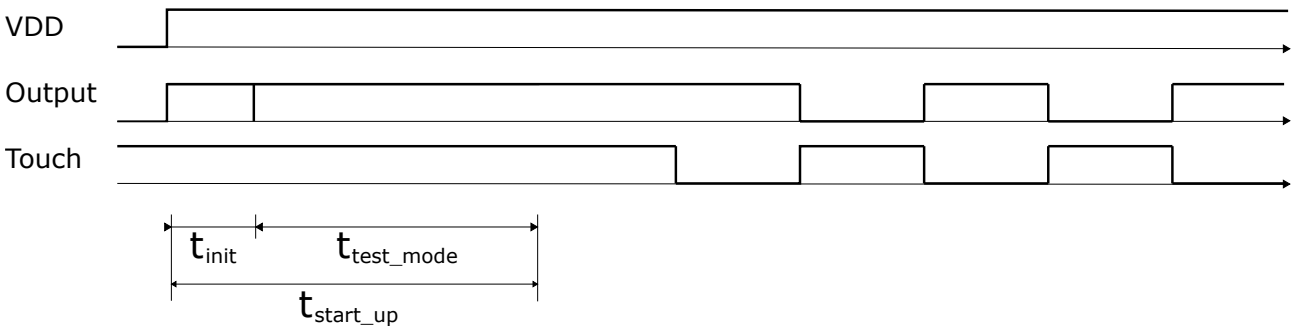

Figure 5.3: IQS318-001, IQS318-101, and IQS318-201 output timing diagram (touch at POR)

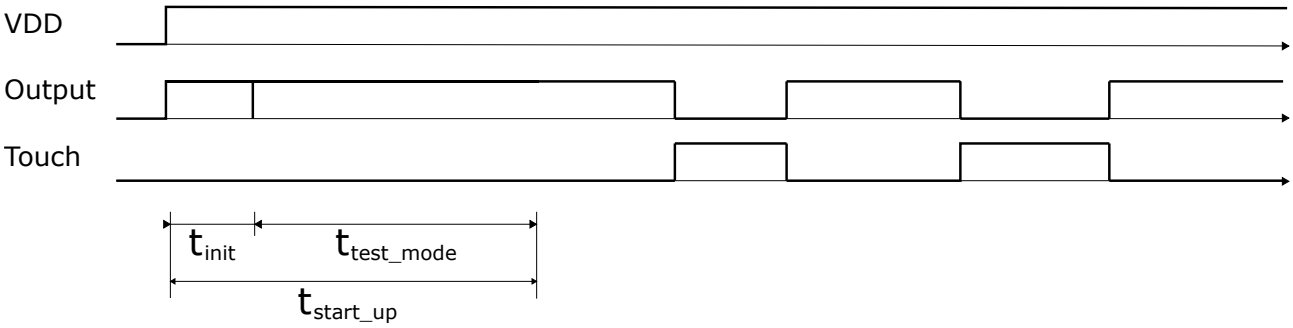

Figure 5.4: IQS318-001, IQS318-101, and IQS318-201 output timing diagram (no touch at POR)

6 ProxFusion® Module

The IQS318 contains a single ProxFusion® module that uses patented technology to measure and process the sensor data.

6.1 Channel Options

The single channel inductive sensors (IQS318-0xx, IQS318-1xx, and IQS318-2xx), and the single channel self-capacitive sensor (IQS318-5xx), are intended for basic standalone and I^2C inductive and capacitive applications.

- Sensor pad design overview: AZD125
- Capacitive button layout guide: AZD125
- Inductive design layout guide: AZD115

6.2 Low Power Options

The IQS318 standalone options offer two sampling period configurations (low SP and high SP). The low sampling period is used for applications that do not require a highly responsive output with lowest power consumption, while the high sampling period is used for applications that require a more immediate response such as repetitive button taps.

6.3 Count Value

The sensing measurement determines a *count value* for the sensing channel. Count values are inversely proportional to the actual analog change in capacitance or inductance, and all outputs are derived from this.

6.3.1 Max Counts

Each channel is limited to having a count value smaller than the *maximum counts*. If the ATI setting or hardware causes a measured count value higher than this, the conversion will be stopped, and the counts will be limited to the maximum value.

6.4 Long-Term Average (LTA)

User interaction is detected by comparing the measured count values to a reference value known as the *LTA*. The LTA of the sensor is slowly updated to track changes in the environment and is not updated during user interaction.

6.4.1 Reseed

When a reseed event occurs the LTA is seeded with the current counts value. Therefore a reseed event will exit any touch or proximity conditions. The IQS318 automatically handles reseed events and a reseed command can be given by setting the corresponding bit (register 0x70, bit3).

6.5 Automatic Tuning Implementation (ATI)

The ATI is an advanced technological feature implemented in ProxFusion® devices to allow optimal performance of the devices for a wide range of sensing electrode capacitances and inductances

without modification to external components. The ATI settings allows the tuning of various parameters. For a detailed description of the ATI see: AZD004.

6.6 Automatic Re-ATI

6.6.1 Description

Re-ATI will be triggered if certain conditions are met. One of the most important features of the Re-ATI is that it allows easy and fast recovery from an incorrect ATI, such as when performing ATI during user interaction with the sensor. This could cause the wrong ATI compensation to be configured, since the user affects the capacitance or inductance of the sensor. A Re-ATI would correct this. Automatic re-ATI is always enabled on the IQS318. For debugging, when a Re-ATI is performed on the IQS318, a status bit will be set momentarily to indicate that this has occurred.

6.6.2 Conditions for Re-ATI to Activate

A Re-ATI is performed when the reference of a channel drifts outside of the acceptable range from the ATI Target. The boundary where Re-ATI occur for a given channel can be adjusted in the registers listed in Table A.9.

$$\textbf{Re-ATI Boundary= ATI target} \pm \left(\frac{1}{8} \times \textbf{ATI Target}\right) \tag{1}$$

For example, assume that the ATI target is configured to 800 and the boundary value is $\frac{1}{8} \times 800 = 100$. If Re-ATI is enabled, the ATI algorithm will be repeated under the following conditions:

LTA > 900 or LTA < 700

The ATI algorithm executes in a short time, so it goes unnoticed by the user.

6.6.3 ATI Error

After the ATI algorithm is performed, a check is done to see if there was any error with the algorithm. An ATI error is reported if one of the following conditions is true for the sensing channel after the ATI is completed:

- ATI Compensation = 0 (min value)
- ATI Compensation = 1023 (max value)
- Count is already outside the Re-ATI range upon completion of the ATI algorithm

If any of these conditions are met, the corresponding error flag will be set (*ATI Error*). The flag status is only updated again when a new ATI algorithm is performed.

Re-ATI will not be repeated immediately if an ATI Error occurs. This is to prevent the Re-ATI repeating indefinitely. An ATI error should however not occur under normal circumstances.

6.7 Channel Outputs

6.7.1 Channel Proximity

A channel proximity event occurs when the channel proximity threshold has been reached and this happens when a target comes into close proximity with the sensing electrode. A channel proximity output is debounced (see Table A.12), and the proximity threshold configured is a delta value (see Table A.12) measuring how much a channels count value has deviated from the reference/LTA value.

6.7.2 Channel Touch

A channel touch event occurs when the touch threshold has been reached. Touch threshold can be calculated as:

$$\textbf{Threshold = value} \times \frac{\textbf{LTA}}{\textbf{256}} \tag{2}$$

The touch hysteresis value determines the corresponding touch release threshold. Release threshold can be calculated as:

$$\textbf{Release threshold} = \frac{\textbf{LTA}}{\textbf{256}} \times \textbf{(Threshold value - Hysteresis value)} \tag{3}$$

6.7.3 Channel Touch Direction

When a channel touch event occurs, the touch direction flag indicates whether the touch is positive or negative and this is only applicable to the IQS318-0xx and IQS318-5xx order codes that make use of the long term activation UI and the dual direction setting.

6.8 Power Mode Timeout

In order to optimise the power consumption and the performance, the power modes are “stepped” by default in order to move to power efficient modes when no interaction has been detected for a certain (configurable) time, known as the “power mode timeout”.

6.9 Sensor Setup

6.9.1 Channel Setup

A single channel is activated on startup. It is designed to detect proximity or touch conditions, and the channel sensitivity, threshold, sampling period, and charge transfer frequency can be adjusted using three input pins on the IQS318. For information about adjusting the channel sensitivity, threshold, sampling period, and charge transfer frequency, see Section 5.1.

6.9.2 Charge Transfer Frequency

The charge transfer frequency (f_{xfer}) is set to a default of 2MHz for the IQS318-0xx, IQS318-1xx, and IQS318-2xx order codes, and 1MHz for the IQS318-5xx order code unless otherwise indicated. F_{xfer} can be used as the T_x frequency by setting bit 5 of register *0x20* to 0 while F_{OSC} can be as the T_x frequency by setting bit 5 of register *0x20* to 1. Note that f_{xfer} is configurable and for more information about the usage of f_{xfer} for an inductive resonant tank design, see Appendix B.

6.9.3 Filter Betas

An Infinite Impulse Response(IIR) filter is applied to the digitised raw input for both the counts value and the LTA. There are two sets of filter settings for the IQS318-0xx, IQS318-1xx, and IQS318-5xx of which one must be selected at startup depending on the configured sampling period (SP). Normal power low SP and ULP low SP filter settings are used for a low sampling period, while normal power high SP and ULP high SP filter settings are used for a high sampling period. For the IQS318-2xx the same filter settings are used for the two power modes.
The damping factor can be calculated as:

$$\textbf{Damping factor} = \frac{\textbf{Beta}}{\textbf{256}} \tag{4}$$

6.10 Watchdog Timer

The IQS318 implements a hardware watchdog timer. The watchdog timer is set to expire after 255ms if not kicked and will trigger a software reset upon expiration.

During I^2C communication the watchdog timer will reset whenever a read or write occurs. Therefore, if the master initiates communication by sending an I^2C START condition and does not complete the I^2C transaction then after 255ms the IQS318 device will reset.

The I^2C transaction is completed either when an I^2C STOP notification is sent by the master or when the master ends the communication as described in Section 7.13.

6.11 Hardware Reset

The MCLR pin (active low) can be used to hard reset the device. For more details see Section 4.2.

7 I²C Interface

7.1 Debug Mode

The IQS318 provides a debug mode or I²C streaming mode for all standalone versions of the product. The debug window enables the user to test different settings and the functionalities of the three input selections described in Section 5.1.

7.2 Conditions for Debugging

The debug window is made available on the standalone devices on startup if the following conditions are met:

- The states of InputB and Output pins must be high
- There must be a pull-up on RDY

Take note that the debug window is only available for a configurable period of time (I²C transaction timeout). If no I²C communication request has been received during this period of time, the device goes into standalone mode.

7.3 Debug Mode to Standalone Mode

In debug mode, the user can test different settings, change register values, and then switch back to standalone mode with the updated settings. In standalone mode the I²C functionality is terminated until the next power cycle.

In addition to the three input selections described in Section 5.1, other engineering settings that can be configured by the user are given in this section and in Section 6. Note that when you switch from debug to standalone mode, the input pin selections are ignored.

7.4 I²C Streaming Mode

For all I²C versions of the product, the IQS318 device goes directly into streaming mode after power on reset.

7.5 I²C Module Specification

The device supports a standard two wire I²C interface with the addition of a RDY (ready interrupt) line. The RDY pin also serves as a Master Clear (MCLR) and can be used to hard reset the device (see Section 6.11). The communications interface of the IQS318 supports the following:

- *Fast-mode-plus* standard I²C up to 1MHz.
- Streaming data as well as event mode.
- The provided interrupt line (RDY) is an open-drain active-low implementation and indicates a communication window.

The IQS318 implements 8-bit addressing with 2 bytes at each address.

7.6 I²C Address

The 7-bit device address for the IQS318-5xx order code is 0x44 ('01000100'). Thus, the full address byte for address 0x44 will be 0x89 (read) or 0x88 (write).

The 7-bit device address for the IQS318-0xx order code is 0x48 ('01001000'). Thus, the full address byte for address 0x48 will be 0x91 (read) or 0x90 (write).

The 7-bit device address for the IQS318-1xx order code is 0x50 ('01010000'). Thus, the full address byte for address 0x50 will be 0xA1 (read) or 0xA0 (write).

The 7-bit device address for the IQS318-2xx order code is 0x52 ('01010010'). Thus, the full address byte for address 0x52 will be 0xA5 (read) or 0xA4 (write).

7.7 I^{3}C Compatibility

This device is not compatible with an I^{3}C bus due to clock stretching allowed for data retrieval.

7.8 Communication During ATI

If an ATI event is triggered then I^{2}C communications are disabled for the duration of the ATI process.

7.9 Memory Map Addressing and Data

The memory map implements 8-bit addressing. Data is formatted as 16-bit words meaning that two bytes are stored at each address. For example, address 0x10 will provide two bytes. The next two bytes read will be from address 0x11.

The 16-bit data is sent in little endian byte order (least significant byte first).

7.10 RDY/IRQ

The communication has an open-drain active-low RDY signal to inform the master that updated data is available. It is optimal for the master to use this as an interrupt input and initiate I^{2}C reads accordingly.

The RDY line allows the master MCU to be woken from low-power/sleep when user presence is detected by the touch device. It is recommended that the RDY be placed on an interrupt-on-pin-change input on the master. On the IQS318 the RDY line also serves as an MCLR pin. MCLR functionality is described in Section 6.11.

7.11 Communications Window

When the device has data for the master, it will pull the RDY line low. This indicates that the device has opened its *communications window* and it is expecting the master to address it. When the communication window is closed the RDY line is released. For information on when the communications window is closed see section 7.13.

Transfer of data between the master and slave must occur during the communications window (RDY is low). If the master wishes to initiate communication, a *Force Communications Request* must be made, after which the master should wait for the slave to pull RDY low before attempting to read or write. Section 7.16.2 describes the *Force Communications Request* sequence.

7.12 I^{2}C Communication Timeout

If the communication window is not serviced within the *I^{2}C timeout* period (in milliseconds), the session is ended (RDY goes high) and processing continues as normal. This allows the system to continue and keep reference values up to date even if the master is not responsive. However, the corresponding

data will be missed/lost. The default I²C timeout period is set to 200ms and can be adjusted in register *0x80*. The maximum I²C communication timeout period is 250ms. The *I²C communication timeout* is measured from the start of the communications window (RDY goes low).

Once communication between the master and the IQS318 has begun (START condition on I²C lines), the I²C communication timeout is disabled leaving the watchdog timer in control. For more information on the behaviour of the device under these conditions see Section 6.10.

7.13 Terminate Communication

A standard I²C STOP will close the current communication window.

If the stop bit disable is set, the device will not respond to a standard I²C STOP. The communication window must be terminated using the end communications command (0xFF) shown in figure 7.1.

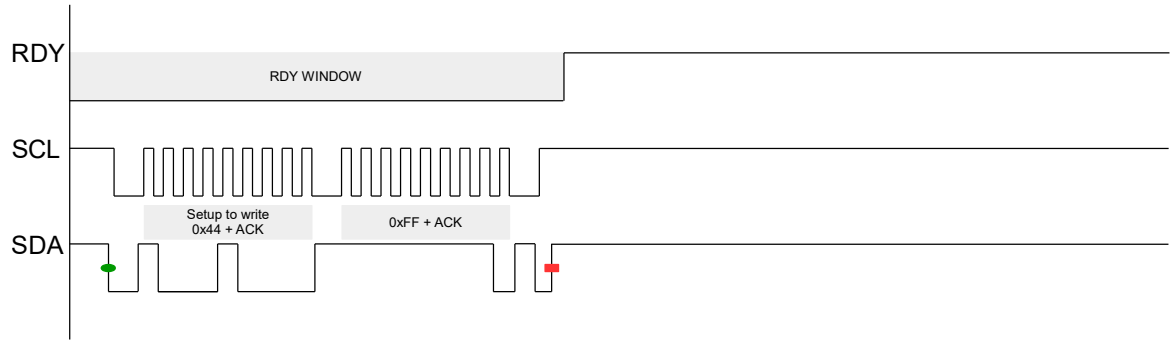

Figure 7.1: Force Stop Communication Sequence

7.14 Invalid Communications Return

The device will give an invalid communication response (0xEE) under the following conditions:

- The host is trying to read from a memory map register that does not exist.
- The host is trying to read from the device outside of a communication window (i.e. while RDY = high)

7.15 I²C Interface Types

The IQS318 has two I²C *Interface Types*, as described in the sections below.

7.15.1 I²C Streaming

I²C Streaming mode refers to constant data reporting at the relevant power mode sampling period specified in register 0x71 (normal power sampling period), and register 0x72 (ultra low power sampling period).

7.15.2 I²C Event Mode

The device can be set up to bypass the communication window when no activity is sensed (event mode). This is enabled to optimise communication and power consumption by only interrupting the master when activity on the sensor occurs. The communication will resume (RDY will indicate available data) if an enabled event occurs.

7.16 Event Mode Communication

Event mode can only be entered if the following requirements are met:

- *Reset Event* bit must be cleared by acknowledging the device reset condition by writing the *(ACK Reset)* bit to clear the System status flag.
- Events must be serviced by reading from the *System Status* register (0x10) to ensure all events flags are cleared otherwise continuous reporting (RDY interrupts) will persist after every conversion cycle similar to streaming mode

7.16.1 Events

Events can be individually enabled to trigger communication, bit definitions can be found in *System Status*.

Using the *Events Mask* register the following events can be enabled:

- ATI error
- ATI event
- Power event
- Touch event
- Proximity event

7.16.2 Force Communication

In streaming mode, the IQS318 I^2C will provide Ready (RDY) windows at intervals specified by the power mode sampling period. Ideally, communication with the IQS318 should only be initiated in a RDY window. A communication request described in the figure below will force a RDY window to open. In event mode, RDY windows are only provided when an event is reported. A RDY window must be requested to write or read settings outside of this provided window. The minimum and maximum time between the communication request and the opening of a RDY window (t_{wait}) is typically less than 1.5ms[i]. The communication request sequence is shown in figure 7.2.

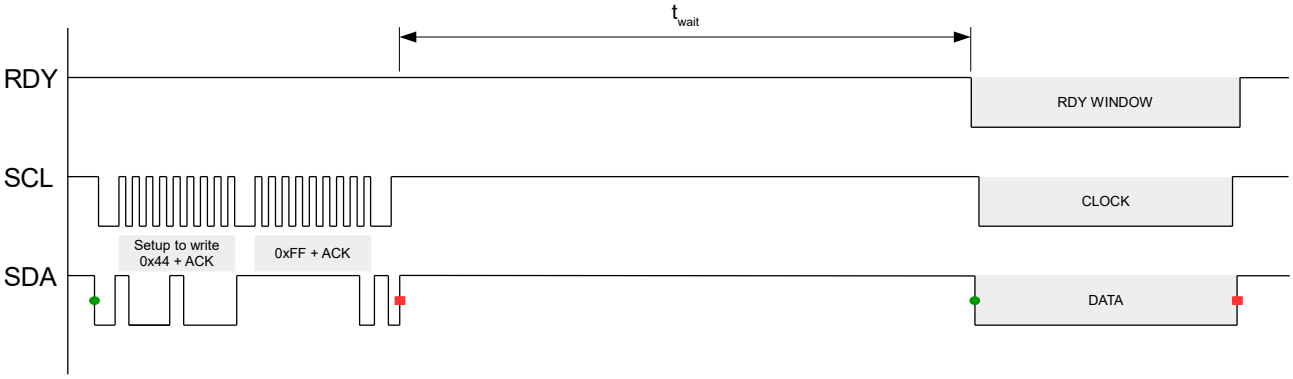

Figure 7.2: Force Communication Sequence

[i] Please contact Azoteq for an application specific value of t_{wait}

B Inductive Resonant Tank Design Guideline

Described below are the steps to design the inductive resonant tank with a certain resonant frequency.

1. For a given inductance L and T_x frequency (f_{tx}), calculate the capacitor C_{calc} for a resonant frequency $f_{tx} \times 1.05$ ($\pm 5\%$ tolerance on f_{tx}).
2. Select a capacitor C_{sel} such that ($C_{sel} \times 1.10$) $\leq C_{calc}$ (assuming a $\pm 10\%$ tolerance on the capacitor).
3. For better safety, 10pF can be removed from parallel tank capacitors less than or equal to 200pF, to account for the T_x and R_x pad capacitance.

Example:

- Given L =1.1uH, use f_{tx} from f_{osc} =14MHz. Determine C_{calc}:

  $f_{resonant}$= 14MHz + 5% = 14.7MHz

  $$\implies 14.7 \times 10^6 = \frac{1}{2\pi\sqrt{1.1x10^{-6} \times C_{calc}}}$$

  $$\implies C_{calc} = 106.56pF$$

- Next, determine C_{sel} such that $1.1 \times C_{sel} \leq C_{calc}$

  $$\implies C_{sel} \leq 96.87pF$$

- Subtract 10pF from C_{sel} since $C_{sel} < 200pF$

  $$\implies C_{sel} = 86.87pF$$

- Using $\pm 10\%$ tolerance on C_{sel} and $f_{resonant} = \frac{1}{2\pi\sqrt{L \times C}} = \frac{1}{2\pi\sqrt{1.1x10^{-6} \times C_{sel}}}$, we get the results below and the summary of the result shown in Figure B.1.

  $C_{sel} = 86.87pF \implies f_{resonant} = 16.28MHz$
  $C_{sel} = 86.87pF + 10\% \implies f_{resonant} = 15.52MHz$
  $C_{sel} = 86.87pF - 10\% \implies f_{resonant} = 17.16MHz$

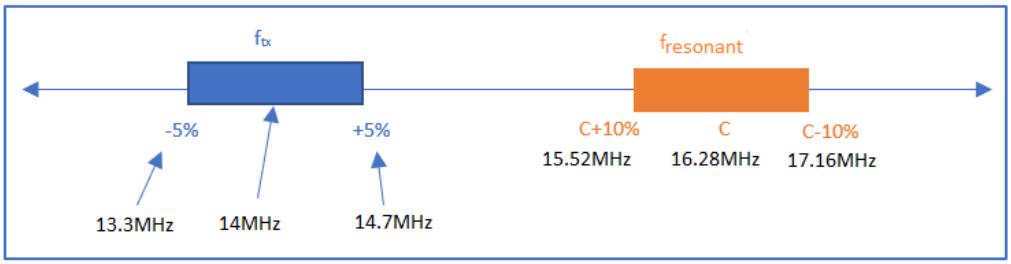

Figure B.1: Inductive Resonant Tank Design

Note: The following order codes start-up with a coil excitation frequency of 14MHz:

- IQS318-001
- IQS318-101
- IQS318-201

I^2C order code options allow for the use of various excitation frequencies.

C Revision History

Release	Date	Changes
v 0.1	April/2023	Initial release
v 1.0	May/2023	Added the description of the IQS318 I^2C order codes: IQS318-000, IQS318-100, and IQS318-500. Updated current measurements also included
v 1.1	August/2023	Introduced the IQS318-510/511 order codes, updated I^2C address, added 14MHz inductive resonant tank design, and other minor updates
v 1.2	November/2023	Introduced the IQS318-200/201 order codes, updated I^2C address, added f_{xfer} input selection, and other minor updates
v 1.3	January/2024	Added the QFN20 package and updated the pin attribute table and ordering information
